Randtheoretische Diagramme zu Eigenrealität

1. Wir gehen aus von der allgemeinen Form eines ternären semiotischen Dualsystems

3.x 2.y 1.z × z.1 y.2 x.3

und bestimmen das situationale semiotische Dualsystem (vgl. Toth 2026a)

3.2 x.y | 2.1 y.z × z.y 1.2 | y.x 2.3

U^{lo} Sys U^{ro} × U^{lo} Sys U^{ro}

Die Kategorie Sys ist weiter differenzierbar in Sys^{lo} und Sys^{ro}.

Dann kann man folgende Trajektionsmatrix bilden:

	U^{lo}	U^{ro}	Sys^{lo}	Sys^{ro}
U^{lo}	—	$U^{lo}U^{ro}$	$U^{lo}Sys^{lo}$	$U^{lo}Sys^{ro}$
U^{ro}	$U^{ro}U^{lo}$	—	$U^{ro}Sys^{lo}$	$U^{ro}Sys^{ro}$
Sys^{lo}	$Sys^{lo}U^{lo}$	$Sys^{lo}U^{ro}$	—	$Sys^{lo}Sys^{ro}$
Sys^{ro}	$Sys^{ro}U^{lo}$	$Sys^{ro}U^{ro}$	$Sys^{ro}Sys^{lo}$	—

2. Im folgenden untersuchen wir das sog. eigenreale Dualsystem (vgl. Bense 1992)

DS: ZKl = (3.1, 2.2, 1.3) × RTh = (3.1, 2.2, 1.3),

d.h. x = 1, y = 2, z = 3

und stellen die 2 mal 24 Kombinationen (vgl. Toth 2026b) in der Form von randtheoretischen Diagrammen (vgl. Toth 2026c) dar.

Zeichenthematik

$T(U^{lo}U^{ro}) = (3.2 \mid 2.3)$
